

Vol For SMEs Memory Analysis Report

Memory Image: sample.raw

Executive Summary

Risk counts: High 1, Medium 0, Low 0, Informational 1.

The memory analysis identified 1 high, 0 medium, 0 low, and 1 informational plugin outcomes.

1 suspicious process(es) identified

1 suspicious network connection(s) identified

The most urgent result is 'Suspicious process: powershell.exe (PID 900)' with high severity and risk score 97.

1 timestamped artefact(s) were available to support timeline reconstruction.

Detailed Findings

Suspicious process: powershell.exe (PID 900) [High | Risk 97]

Category: Process Finding

Affected asset: powershell.exe (PID 900)

Summary: malfind identified suspicious injected or executable memory, suspicious command-line execution pattern

Possible attack: Process Injection

What it means: Code may have been inserted into another process to hide execution, steal data, or evade controls.

MITRE ATT&CK:

- T1055 - Process Injection

Evidence:

- malfind identified suspicious injected or executable memory

- suspicious command-line execution pattern

Recommended remediation:

- Capture the affected process memory and preserve the host for deeper investigation.

- Isolate the endpoint and reset credentials used on the system if compromise is suspected.

- Reimage or rebuild the system if malicious injection is confirmed.

- Review the process parent, command line, loaded modules, and associated user account.

- Collect the process binary and any referenced scripts for malware analysis.

windows.malfind [High | Risk 95]

Category: Plugin Finding

Summary: 1 suspicious indicator(s) detected

Possible attack: Process Injection

What it means: Code may have been inserted into another process to hide execution, steal data, or evade controls.

MITRE ATT&CK:

- T1055 - Process Injection

Evidence:

- Injected or RWX memory candidate in powershell.exe | PID 900

Recommended remediation:

- Capture the affected process memory and preserve the host for deeper

investigation.

- Isolate the endpoint and reset credentials used on the system if compromise is suspected.
- Reimage or rebuild the system if malicious injection is confirmed.
- Review the full plugin output to confirm whether the indicator reflects malicious behaviour or legitimate administration.

Suspicious network activity: powershell.exe (PID 900) [High | Risk 88]

Category: Network Finding

Affected asset: powershell.exe (PID 900)

Summary: interactive shell process communicating over the network

Possible attack: Application Layer Protocol

What it means: Suspicious traffic may be using normal network protocols to communicate with remote systems or command infrastructure.

MITRE ATT&CK:

- T1071 - Application Layer Protocol

Evidence:

- 10.0.0.5:49152 -> 8.8.8.8:443 (established)
- interactive shell process communicating over the network

Recommended remediation:

- Inspect the remote endpoints, associated domains, and firewall or proxy logs.
- Block confirmed malicious destinations and monitor for repeated contact attempts.
- Correlate the connection with the owning process and any downloaded content.
- Check whether the remote endpoint is known, internal, or already blocked by security controls.
- Review proxy, DNS, and firewall logs for related traffic from the same host.

Timeline Highlights

2024-01-01T10:00:00+00:00 - powershell.exe reported by windows.pslist (CreateTime)
