

Vol For SMEs Known Malware Triage Report

Memory Image: sample.raw
Output Directory: reports/triage
Clamav Available: True

Executive Summary

Risk counts: High 3, Medium 0, Low 0, Informational 0.

The known malware triage identified 3 high, 0 medium, 0 low, and 0 informational findings.

1 known malware signature hit(s) were detected in dumped artefacts.

1 suspicious process(es) identified

The most urgent result is 'Suspicious process: powershell.exe (PID 900)' with high severity and risk score 105.

Detailed Findings

Suspicious process: powershell.exe (PID 900) [High | Risk 105]

Category: Process Finding

Affected asset: powershell.exe (PID 900)

Summary: malfind reported possible injected executable memory, Command line contains encoded PowerShell command

Possible attack: Process Injection

What it means: Code may have been inserted into another process to hide execution, steal data, or evade controls.

MITRE ATT&CK:

- T1055 - Process Injection
- T1059.001 - PowerShell

Evidence:

- malfind reported possible injected executable memory
- Command line contains encoded PowerShell command

Recommended remediation:

- Capture the affected process memory and preserve the host for deeper investigation.
- Isolate the endpoint and reset credentials used on the system if compromise is suspected.
- Reimage or rebuild the system if malicious injection is confirmed.
- Review PowerShell logs, transcription, and AMSI/EDR telemetry if available.
- Look for encoded commands, downloaded content, and child process creation.
- Apply constrained language mode or execution policy controls where suitable.

High-risk suspicious process activity detected [High | Risk 70]

Category: Triage Finding

Summary: 1 process(es) reached a High severity suspicion score based on memory forensic indicators.

Possible attack: Process Injection

What it means: Code may have been inserted into another process to hide execution, steal data, or evade controls.

MITRE ATT&CK:

- T1055 - Process Injection
- T1059.001 - PowerShell

Evidence:

- One or more processes had a suspicious score of 70 or above
- high process count: 1

Recommended remediation:

- Capture the affected process memory and preserve the host for deeper investigation.
- Isolate the endpoint and reset credentials used on the system if compromise is suspected.
- Reimage or rebuild the system if malicious injection is confirmed.
- Review PowerShell logs, transcription, and AMSI/EDR telemetry if available.
- Look for encoded commands, downloaded content, and child process creation.
- Apply constrained language mode or execution policy controls where suitable.

Known malware signature detected [High | Risk 60]

Category: Triage Finding

Summary: ClamAV detected a known malware signature in a file dumped from memory.

Possible attack: Known malware triage finding

What it means: This result deserves review because the analysis heuristics flagged: clamav detected a known malware signature in a file dumped from memory..

Evidence:

- ClamAV signature matched: Win.Test.Eicar
- file: volatility_dumps/malfind.pid_900.dmp
- signature: Win.Test.Eicar

Recommended remediation:

- Preserve the affected host and memory image for follow-up investigation.
- Validate the finding against endpoint telemetry, logs, and approved software records.
- Contain the host if multiple suspicious findings point to active compromise.

Timeline Highlights

No timestamped artefacts were available for timeline reporting.
